

Interpolation in First-Order Logic with Equality

Master Thesis Presentation

Bernhard Mallinger

Advisor: Stefan Hetzl

Institute of Discrete Mathematics and Geometry
TU Wien

12. Oktober 2014

Notes (cover this somewhere)

- interpolants can be extracted from resolution proofs since skolemisation and the cnf transformation doesn't change the set of interpolants

Agenda

- 1 Introduction
- 2 Craig Interpolation (10 min)
 - Interpolation and Equality (1 slide)
 - Applications (1 slide)
- 3 Proof by reduction (6 min)
- 4 Interpolant extraction from resolution proofs (10 min)
 - Introduction
 - Phase one (propositional, inductive)
 - Phase two (lifting, ordering)
 - Optional: Number of quantifier alternations
 - Proof with one phase: Can lift earlier.
- 5 Semantic Proof (6 min)
- 6 Conclusion
 - References

Introduction

- Want concrete algorithms for FOL/EQ
⇒ Little attention so far
- Present different constructive proofs

Craig Interpolation

Theorem (Craig). Let Γ and Δ be sets of first-order formulas where

- Γ contains red and gray symbols and
- Δ contains blue and gray symbols

such that:

- $\Gamma \models \Delta$

Then there is a interpolant I containing only gray symbols such that:

- $\Gamma \models I$
- $I \models \Delta$

Interpolation and Equality

Example

- Let $\Gamma = \{P(a), \neg P(b)\}$ and $\Delta = \{a \neq b\}$.
- Clearly $\Gamma \models \Delta$.
- Only possible interpolant: $a \neq b$

Interpolation and Equality

Example

- Let $\Gamma = \{P(a), \neg P(b)\}$ and $\Delta = \{a \neq b\}$.
- Clearly $\Gamma \models \Delta$.
- Only possible interpolant: $a \neq b$

Applications

- Proof of Beth's Definability Theorem
- Model checking
- Detecting loop invariants

Agenda

Proof by reduction

Reduction to FOL without equality and function symbols:

Translate equality and function symbols:

$$\begin{aligned} (P(c))^* &\equiv \exists x (C(x) \wedge P(x)) \\ (P(f(c)))^* &\equiv \exists x (\exists y (C(y) \wedge F(y, x)) \wedge P(x)) \\ (s = t)^* &\equiv E(s, t) \end{aligned}$$

Add axioms for equality and new predicate symbols:

$$\varphi \rightarrow \left(T_E \wedge \bigwedge_{f \in FS} T_f \right) \supset \varphi^*$$

Clearly φ and φ^* are equisatisfiable.

Proof in FOL without equality and FS

Lemma (Maehara)

Let Γ and Δ be sets of first-order formulas without equality and function symbols such that $\Gamma \vdash \Delta$ is provable in *sequent calculus*. Then for any partition $\langle (\Gamma_1; \Delta_1), (\Gamma_2; \Delta_2) \rangle$ there is an interpolant I such that

- 1 $\Gamma_1 \vdash \Delta_1, I$ is provable
- 2 $\Gamma_2, I \vdash \Delta_2$ is provable
- 3 $L(I) \subseteq L(\Gamma_1, \Delta_1) \cap L(\Gamma_2, \Delta_2)$

[Baaz and Leitsch, 2011] presents a strengthening which includes function symbols.

Open question: Can it be extended to include equality?

Proof in FOL without equality and FS

Lemma (Maehara)

Interpolant extraction

Motivation

- Proof by reduction is impractical
- Goal: Compute interpolants from proof
- The following is based on [Huang, 1995]

Interpolant extraction from resolution proofs

- Skolemisation and clausal form transformation do not alter the set of interpolants
- Have to use “reverse” (but equivalent) formulation of interpolation

Interpolant extraction

Motivation

- Proof by reduction is impractical
- Goal: Compute interpolants from proof
- The following is based on [Huang, 1995]

Interpolant extraction from resolution proofs

- Skolemisation and clausal form transformation do not alter the set of interpolants
- Have to use “reverse” (but equivalent) formulation of interpolation

Huang's algorithm

Proof:

\Downarrow *Extract propositional interpolant structure from proof*

Propositional Interpolant:

$\dots Q(\textcolor{red}{f}(\textcolor{blue}{c}), \textcolor{blue}{c}) \dots$

\Downarrow *Replace colored function and constant symbols*

Prenex First-Order Interpolant:

$\exists x_3 \forall x_5 \dots Q(x_5, x_3) \dots$

Conclusion

- Craig's and Huang's proof based interpolant extraction from proofs
⇒ differ in applicability
- Craig shows that the interpolation theorem holds also in FOL/EQ
- Huang shows that interpolants can efficiently be extracted in FOL/EQ
 - Does not require different methods
 - Little attention so far in research
- Interpolation also allows for a model theoretic approach
