## 1 Missing

- quantifier free methods

## 2 Intro/Motivation

vague description

### 2.1 Craig Interpolation

statement, proof (in resolution? how to prove best there?)

proof from wikipedia?

idea of construction from proofs

relation of interpolant length to min proof length (pudlak97)

#### 2.1.1 Problem of equality

equality in interpolant necessary

## 2.2 Applications, Usages

erst nach statement um es formal verwenden zu können

McMillan-style practical results (Overapproximation of reachable states)

auch von Henzinger. Abstractions from proofs

## 3 Constructive Proofs/Algorithms for interpolation w.r.t. how they (can) handle equality

### 3.1 Reduction to FOL without equality (Craig)

not practical, but proves the basic result

### 3.2 Overbinding during interpolant extraction as in Takeuti

excludes function symbols and equality -> currently open question whether that can handle equality

reduction of function symbols to predicate symbols

### 3.3 Overbinding as second step as in Baaz/Leitsch

show proof technique, does not work in presence of equality (destroyed by replacing terms by variables, e.g.  $a = b \vdash f(a) = f(b)$ , but  $a = b \not\vdash x = f(b)$ ).

### 3.4 Huang

present full paper

## 4 Further results

### 4.1 Semantic proofs – model theoretic perspective

shoenfield, chang/keisler

direct model theoretic proof of interpolation as in D'Silva: Propositional Interpolation and Abstract Interpretation ?

### 4.2 Beth definability

### 4.3 Interpolation is skolemisation-invariant

### 4.4 Lyndon
